AMINOARYL OXAZOLIDINONE N-OXIDES

FIELD OF THE INVENTION

The present invention provides for aminoaryl oxazolidinone N-oxide
5 compounds. These compounds are exceedingly water soluble which is useful in
preparing pharmaceutical formulations of these compounds. They are also rapidly
converted back to the parent amines *in vivo*, making them useful as prodrugs of the
parent amines.

These compounds have antibiotic activity comparable to the parent amines.
10 They are effective against a number of human and veterinary pathogens, including
gram-positive aerobic bacteria such as multiply-resistant staphylococci, streptococci
and enterococci as well as anaerobic organisms, such as *Bacteroides spp.* and
Clostridia spp. species, and acid-fast organisms such as *Mycobacterium tuberculosis*,
Mycobacterium avium and *Mycobacterium spp.*, and in organisms such as
15 *Mycoplasma spp.*

BACKGROUND OF THE INVENTION

Nowhere do these patents, applications or publications teach or suggest N-

oxide oxazolidinone compounds.

INFORMATION DISCLOSURE

U.S. Patent No. 4,722,928 discloses N-oxide prodrug derivatives of 3-hydroxy morphinans and partial morphinans analgesics, agonist-antagonists, and narcotic
5 antagonists, which are useful therapeutic entities providing enhanced bioavailability of these compounds from orally administered dosage forms. In contrast, there is no change in the bioavailability of the N-oxide compounds of the present invention.

This patent further states that there is no way to accurately predict which prodrug structure will be suitable for a particular drug. A derivative which may
10 work well for one drug may not do so for another. Differences in the absorption, metabolism, distribution, and excretion among drugs do not permit generalizations to be made about prodrug design.

Chemical Abstracts 118:147331y (1993) discloses anti-cancer anthracene amine N-oxide prodrugs with low cytotoxicity which are bio-reduced within anaerobic
15 neoplastic tissue to the cytotoxic amine anticancer agents. There is no suggestion that N-oxide prodrugs can be bio-reduced in normal tissue. These compounds are also potentially useful against anaerobic bacterial and protozoal infections.

L.H. Patterson, "Rationale for the use of aliphatic N-oxides of cytotoxic anthraquinones as prodrug DNA binding agents: a new class of bio-reductive agent,"
20 *Cancer and Metastasis Review* 12:119-134 (1993) discloses that such N-oxides are not intrinsically cytotoxic. It further states that investigations into the fate of N-oxide administration to animals show that, in general, aliphatic N-oxides are stable *in vivo* and are recovered quantitatively following intravenous dosing. Hence, the article concludes that it would appear that aliphatic N-oxides are not metabolised in
25 oxygenated tissue to any significant extent. In contrast, the aliphatic N-oxide compounds of the present invention are surprisingly and unexpectedly reduced back to the parent amine very rapidly *in vivo*.

The problem in the art is difficulty in formulating the parent amine compounds for intravenous and injectable use. The N-oxide compounds of the
30 present invention have high water solubility and are readily formulated in aqueous vehicles.

GENERAL PROCEDURE:

The compounds of this invention are prepared by oxidation of a suitable precursor amine with any of a variety of oxidizing agents. Suitable oxidants include pertrifluoroacetic acid, meta-chloroperbenzoic acid (MCPBA), and magnesium monoperoxyphthalate (MMPP). For example, the synthesis is shown below for the case wherein Q¹ is morpholine and the oxidant is MMPP.

Oxidation of any of the oxazolidinones of Charts I-IX in which Q² is any of the other groups previously described is carried out similarly.

Charts X-XVIII show the final N-oxide compounds of the present invention which are prepared from the parent amines of Charts I-IX, respectively, by using the above General Procedures.

It will be apparent to those skilled in the art that the described synthetic procedures are merely representative in nature and that alternative synthetic processes are known to one of ordinary skill in organic chemistry.

The compounds of the present invention have an advantage over the parent amines in being exceedingly water soluble (see Table 1 below). For example, the compound of Example No. 2 has a solubility of 409 mg/ml. The parent amine has a water solubility of only 3.7 mg/ml. The N-oxide compounds of the present invention also retain all the *in vitro* and *in vivo* activities of the parent amines. The enhanced water solubility makes the N-oxide compounds of the present invention ideal for intravenous or injectable formulations.

Table 1. Solubility Data for the N-oxides and parent amines.

Example Number	Parent Amine Solubility (mg/mL)	N-Oxide Solubility (mg/mL)
1	4.2	348
2	3.7	534
3	0.28	12.9
6	0.031	1.1

Procedure for Measuring Solubility:

In all solubility studies, an excess of compound is added to 0.5 to 1 ml of pH 7, 50 mM phosphate buffer or other vehicle of interest. The samples are capped and stirred via magnetic stir bars for 24 to 48 hours at room temperature. Samples are filter centrifuged (800 x g) for 5-10 minutes through Millipore Ultrafree-MC 0.22 micron filter units. The supernate is analyzed by either UV or HPLC to quantitate the drug concentration. Results of the solubility testing of the compounds of the present invention are given above in Table 1.

The oxazolidinone compounds of the present invention have useful activity against a variety of microorganisms. The *in vitro* activity of compounds of the present invention are assessed by standard testing procedures such as the determination of minimum inhibitory concentration (MIC) by agar dilution as described in "Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically" (MFT) published January 1993 by the National Committee for Clinical Laboratory Standards (NCCLS), 771 East Lancaster Avenue, Villanova, Pennsylvania 19084, USA. The activity of selected compounds of the present invention against *Staphylococcus aureus* and *Streptococcus pneumoniae* are shown in Table 2.

Table 2. Activity of the N-oxides against *S. Aureus* and *S. Pneumoniae*.

As such, the compounds of the present invention are useful for treating microbial infections in humans or other warm-blooded animals by administering to a patient in need thereof an effective amount of a compound of Formula I. The compound is administered in a pharmaceutical composition orally, parenterally (such as subcutaneously or intravenously), or topically. Preferably the compound is administered in an amount of from about 0.1 to about 100 mg/kg of body weight/day, more preferably, from about 3.0 to about 50 mg/kg of body weight/day.

5 **EXAMPLE 7:** Reduction of the N-oxide of Example 2 *in vivo* Following
Intravenous and Oral Administration to Rats.

The rate and extent of reduction of the N-oxide of Example 2 was investigated *in vivo* using the following procedures: Six male Sprague-Dawley rats are used for this study. Three rats are given a single intravenous 10 mg/kg dose of the
10 N-oxide and three rats are given a single oral 25 mg/kg dose of the N-oxide. Blood is collected pre-dose and up to 24 h post dose. The plasma is analyzed for the N-oxide and the parent amine by LC-MS.

Results:

Only traces of the N-oxide were found in plasma in the first time point
15 immediately post intravenous injection. The parent amine was detected in plasma up to 10 h post dosing. The lower limit of quantitation for the assay was ~0.01 µg/mL. Because the N-oxide was reduced to the parent amine so rapidly, pharmacokinetic parameters were measured for the parent amine rather than for the N-oxide.

20 After both intravenous and oral dosing of the N-oxide, the C_{max}, T_{max} and AUC values for the parent amine were very similar to those found when the parent amine compound was administered directly to rats using the same doses and protocol. The relative bioavailability of the parent amine from the orally administered N-oxide was approximately 100% when compared to orally
25 administered parent amine. The rapid and essentially quantitative conversion of the N-oxide to the parent amine *in vivo* demonstrates that the N-oxide is a suitable pro-drug for the parent amine.
